Data acquisition and management for breast augmentation – preoperative assessment 8. Breast implants and implant soft-tissue dynamics – the next level of surgeon understanding that determines long-term outcomes for the patient 9.[4] Your decision to have breast augmentation is a highly personal one. Not everyone will understand.[5] The government in the UK set up an Independent Review Group (IRG), which reported in the latter part of 1998 and found no association between the use of silicone gel for breast augmentation and any disease process. As far as human adjuvant disease is concerned, it concluded that there was no justification for continuing epidemiological studies into a link since, having reviewed the evidence available, they felt that there was no reason to suspect any such association.[6]

Infection is fortunately very rare after breast augmentation. Should it occur, it will exhibit itself by swelling and redness appearing up to three weeks after surgery.[7] Patients requesting breast augmentation are seen on at least two occasions in order to talk through all the issues and choose the best size and approach. It is possible to talk to other women who have undergone the procedure and to see representative photographs of results.[8] Transaxillary endoscopic breast augmentation was performed under general anesthesia with the patient in a prone position with arms abducted to ninety degrees. Local anesthesia with epinephrine was injected into the axillary incision and in the soft tissue overlying the anterior axillary fold for hemostasis.[9]

Most capsular contracture post breast augmentation stems from using smooth shell breast implants but with modern textured surface implants the incidence of encapsulation is low, probably around 5%. It is not known why this condition develops in some cases and not others.[10] Surgery is never something to be entered into lightly, but many women say their lives have been irrevocably changed for the better following breast augmentation surgery. A "boob job", when done properly, can give a woman back her self-confidence if she is unhappy with the size of her breasts, has asymmetrical breasts, following childbirth, weight gain or weight loss, or an illness such as cancer.[11] Each breast augmentation surgery is unique to the individual and the surgeon's individual approach towards the patient corresponds accordingly. A state of good health is a natural prerequisite.[12]

Breast enlargement, sometimes known as breast augmentation, is a procedure which has been around for over 100 years. The first known operation was completed in 1890 and used paraffin injections.[16] The TBA procedure without endoscopic assistance is a simple and reliable technique for breast augmentation. Most of the complications in this study were minor and predictable.[17] During a recent three years period (2005-2007), we carried out breast augmentation (primary or secondary) with mammary implants in 73 Asian patients. Surgery was by either peri-areolar or transaxillary endoscopic approach (57%).[18]

A good percentage of women will want breast augmentation so long as a good percentage of women are concerned about being attractive. Given the magnitude of the cosmetics, fashion and fitness industries, I would imagine this continue for some time.[25] Many women choose to have a breast enlargement, also known as breast augmentation or commonly referred to as a 'boob job', because it increases breast size and creates a lovely, full shape. It is usually considered by women who have always wanted a bigger cup size, or after pregnancy, breast feeding or even weight loss.[26] There is no reason to pay thousands of dollars for potentially dangerous breast augmentation surgery .not anymore. Don't suffer the pain or be embarrassed for life by the scars left behind after one of these procedures.[27]
